Tor and circumvention: Lessons learned

Roger Dingledine
The Tor Project
https://torproject.org/
What is Tor?

- Online anonymity 1) open source software, 2) network, 3) protocol
- Community of researchers, developers, users, and relay operators
- Funding from US DoD, Electronic Frontier Foundation, Voice of America, Google, NLnet, Human Rights Watch, NSF, US State Dept, SIDA, ...
The Tor Project, Inc.

- 501(c)(3) non-profit organization dedicated to the research and development of tools for online anonymity and privacy
Estimated 200,000 daily Tor users
Threat model: what can the attacker do?

- Alice
  - Watch Alice!

- Anonymity network
  - Control part of the network!

- Bob
  - Watch (or be!) Bob!
Anonymity isn't cryptography: Cryptography just protects contents.
Anonymity isn't just wishful thinking...

“You can't prove it was me!”

“Promise you won't look!”

“Promise you won't remember!”

“Promise you won't tell!”

“I didn't write my name on it!”

“Isn't the Internet already anonymous?”
Anonymity serves different interests for different user groups.

“It's privacy!”

Anonymity

Private citizens
Anonymity serves different interests for different user groups.

- **Private citizens**: “It's privacy!”
- **Businesses**: “It's network security!”

Anonymity

Diagram:
- Anonymity
  - Private citizens: “It's privacy!”
  - Businesses: “It's network security!”
Anonymity serves different interests for different user groups.

"It's traffic-analysis resistance!"

Governments

Anonymity

Businesses

"It's network security!"

"It's privacy!"

Private citizens
Anonymity serves different interests for different user groups.

- **Governments**: “It's traffic-analysis resistance!”
- **Private citizens**: “It's privacy!”
- **Businesses**: “It's network security!”
- **Human rights activists**: “It's reachability!”

Anonymity
The simplest designs use a single relay to hide connections.

(example: some commercial proxy providers)
But a single relay (or eavesdropper!) is a single point of failure.
... or a single point of bypass.

Timing analysis bridges all connections through relay ⇒ An attractive fat target
So, add multiple relays so that no single one can betray Alice.
A corrupt first hop can tell that Alice is talking, but not to whom.
A corrupt final hop can tell that somebody is talking to Bob, but not who.
Alice makes a session key with R1
...And then tunnels to R2...and to R3
What we spend our time on

- Performance and scalability
- Maintaining the whole software ecosystem
- Blocking-resistance (circumvention)
- Basic research on anonymity
- Reusability and modularity
- Advocacy, education, and trainings around the world
- Metrics, data, and analysis
Another Iran user count

- Talked to chief security officer of one of the web 2.0 social networking sites:
  - 10% (~10k) of their Iranian users in June 2009 were coming through Tor
  - 90% (~90k) were coming from proxies in the Amazon cloud
Iran and DPI

• We made Tor's TLS handshake look like Firefox+Apache.

• When Iran kicked out Smartfilter in early 2009, Tor's old (non-TLS) directory fetches worked again!

• Jan 2011, Iran blocked Tor by DPI for SSL and filtering our Diffie-Hellman parameter.

• Socks proxy worked fine the whole time.
Directly connecting Iranian Tor users

The Tor Project - https://metrics.torproject.org/
Relay versus Discovery

- There are two pieces to all these “proxying” schemes:
  - a relay component: building circuits, sending traffic over them, getting the crypto right
  - a discovery component: learning what relays are available
The basic Tor design uses a simple centralized directory protocol.

Servers publish self-signed descriptors.

Authorities publish a consensus list of all descriptors.

Alice downloads consensus and descriptors from anywhere.
Attackers can block users from connecting to the Tor network

- By blocking the directory authorities
- By blocking all the relay IP addresses in the directory
- By filtering based on Tor's network fingerprint
- By preventing users from finding the Tor software
“Bridge” relays

- Hundreds of thousands of Tor users, already self-selected for caring about privacy.
- Rather than signing up as a normal relay, you can sign up as a special “bridge” relay that isn't listed in any directory.
- No need to be an “exit” (so no abuse worries), and you can rate limit if needed.
- Integrated into Vidalia (our GUI) so it's easy to offer a bridge or to use a bridge.
How do you find a bridge?

- [https://bridges.torproject.org/](https://bridges.torproject.org/) will tell you a few based on time and your IP address
- Mail bridges@torproject.org from a gmail address and we'll send you a few
- I mail some to a friend in Shanghai who distributes them via his social network
- You can set up your own private bridge and tell your target users directly
Number of directory requests to directory mirror trusted

Directly connecting Libyan Tor users

The Tor Project - https://metrics.torproject.org/
Directly connecting Saudi Tor users

The Tor Project - https://metrics.torproject.org/
Saudi users via bridges

The Tor Project - https://metrics.torproject.org/
Attacker's goals

• Little reprisal against passive consumers of information.
  – Producers and distributors of information in greater danger.

• Censors (actually, govts) have economic, political, social incentives not to block the whole Internet.
  – But they don't mind collateral damage.
What we're up against

- Govt firewalls used to be stateless. Now they're buying fancier hardware.
  - Burma vs Iran vs China
- New filtering techniques spread by commercial (American) companies :(
- How to separate “oppressing employees” vs “oppressing citizens” arms race?
Javascript, cookies, history, etc

- Javascript refresh attack
- Cookies, History, browser window size, user-agent, language, http auth, ...
- Mostly problems when you toggle from Tor to non-Tor or back
- Mike Perry's Torbutton Firefox extension tackles many of these
Flash is dangerous too

• Some apps are bad at obeying their proxy settings.
• Adobe PDF plugin. Flash. Other plugins. Extensions. Especially Windows stuff: did you know that Microsoft Word is a network app?
Choose how to install it

- Tor Browser Bundle: standalone Windows exe with Tor, Vidalia, Firefox, Torbutton, Polipo, e.g. for USB stick
- Vidalia bundle: Windows/OSX installer
- Tor VM: Transparent proxy for Windows
- “Net installer” via our secure updater
- Amnesia Linux LiveCD
Only a piece of the puzzle

- Assume the users aren't attacked by their hardware and software
  - No spyware installed, no cameras watching their screens, etc
- Users can fetch a genuine copy of Tor?
Publicity attracts attention

• Many circumvention tools launch with huge media splashes. (The media loves this.)
• But publicity attracts attention of the censors.
• We threaten their appearance of control, so they must respond.
• We can control the pace of the arms race.
Using Tor in oppressed areas

- Common assumption: risk from using Tor increases as firewall gets more restrictive.
- But as firewall gets more restrictive, more ordinary people use Tor too, for more mainstream activities.
- So the “median” use becomes more acceptable?
Trust and reputation

• See January 2009 blog post by Hal Roberts about how some circumvention tools sell user data
• Many of these tools see circumvention and privacy as totally unrelated goals
I CAN HAZ FREEDOM?

TorProject.org
Advocacy and education

- Unending stream of people (e.g. in DC) who make critical policy decisions without much technical background
- Worse, there's a high churn rate
- Need to teach policy-makers, business leaders, law enforcement, journalists, ...
- Data retention? Internet driver's license?
Our NSF EAGER

• 1) Invent and deploy new privacy-preserving algorithms to collect data about the Tor network, its performance, and its users

• 2) Publish this data, plus tools to analyze it

• 3) Figure out what else to measure and do it

• 4) Work with other research groups to make sure they get the data they need to solve the problems Tor actually has
Next steps (policy)

- Technical solutions won't solve the whole censorship problem. After all, firewalls are socially very successful in these countries.
- But a strong technical solution is still a critical puzzle piece.
- You should run a bridge! We only have 750.
- We'd love to help with some trainings, to help users and to make Tor better.
BridgeDB needs a feedback cycle

- Measure how much use each bridge sees
- Measure bridge blocking
- Then adapt bridge distribution to favor efficient distribution channels
- Need to invent new distribution channels
- Need more and changing bridge addresses
  - Redirecting a whole /16?
  - Promote clients to bridges?
Measuring bridge reachability

- Passive: bridges track incoming connections by country
- Active: scan bridges from within the country
- Clients self-report blockage (via some other bridge)
- Measure remotely via FTP reflectors
- Bridges test for duplex blocking
Other components

• Traffic camouflaging
  – Super-encrypt so no recognizable bytes? Shape like HTTP?
  – We're working on a modular transport API

• Client-side automation for usability

• Performance / scalability
  – Especially for low bandwidth
Time in seconds to complete 50 KiB request

Measured times on all sources per day

- Median
- 1st to 3rd quartile
